Whilst footfall induced vibrations on buildings and bridges is not normally significant in terms of structural integrity, footfall induced vibration can be a critical serviceability condition. This publication presents a method of evaluating the vibration due to a single pedestrian walking on a flat

### **FOOTFALL ANALYSIS GUIDE - MyAxisVM**

A Design Guide for Footfall Induced Vibration of Structures, by M R Willford and P Young, published for The Concrete Centre by The Concrete Society, presents a new method for evaluating the vibration due to a single pedestrian walking on a flat surface, such as a floor slab or bridge deck. The method was developed by Arup, and has been calibrated and refined with verification measurements taken on completed structures over a period of ten years.

### **Assessment of footfall induced vibrations in floors**

Two commonly used analysis methods to predict footfall vibration levels in steel buildings are the American Institute of Steel Construction (AISC) Design Guide 11, and The Steel Construction Institute (SCI) P354. The latter is more robust, as it can predict multi-modal time history responses at any point on the floor.
