Notice that in some nodes (like between R 1 and R 2) the current is the same going in as at is coming out. At other nodes (specifically the three-way junction between R 2, R 3, and R 4) the main (blue) current splits into two different ones. That's the key difference between series and parallel!. Series Circuits Defined. Two components are in series if they share a common node and if the same ...

The defining characteristic of a series circuit is that there is only one path for current to flow. In this circuit, the current flows in a clockwise direction, from point 1 to point 2 to point 3 to point 4 and back around to 1. Parallel Circuit Configuration. Now, let's look at the other type of circuit, a parallel configuration:

What is Parallel Circuit - How to Make, Characteristics ...

In a parallel circuit, all the components are connected with their corresponding ends joined together at common points to form separate and parallel paths. These paths are called branches. Figure shows a parallel circuit, where the three bulbs, L 1 , L 2 and L 3 and their respective switches are connected with their ends joined at two common points before the ends are connected to a cell.

With simple series circuits, all components are connected end-to-end to form only one path for the current to flow through the circuit. With simple parallel circuits, all components are connected between the same two sets of electrically common points, creating multiple paths for the current to flow from one end of the battery to the other.
