Macroevolution is evolution over geologic time above the species level. One of the main topics in macroevolution is how new species arise; this process is known as speciation. How does speciation usually happen? First a species become isolated. Assume that some members of a species become geographically separated from the rest of the species.

Though microevolution study is narrow in the evolution of populations within the same species, it helps to understand broadly how differences arose between human population, how humans became susceptible to certain diseases over the time, how fertility factors have been decreased in humans over the time, etc. Microevolution can provide insight into any differences in a particular population. Especially, scientists use microevolution of the human population in order to gain insight into the
