These changes are a direct and necessary result of the mandate to stay abreast of regulatory requirements and a policy intended to clarify the QC steps considered to be an integral part of each test method. Additional QC steps were added to almost half of the sections."--Pref. p. iv.

Conservation research in libraries is a rapidly growing field. This book places analysis within its context in conservation and provides examples of how this expensive resource can be used. Through a series of case studies, it describes major analytical procedures, including visualization, molecular, elemental and separation techniques as well as chemical tests. It is thus a suitable reference work for library conservators and curators. Please note: Despite careful production of

our books, sometimes mistakes happen. Unfortunately, the authorship for some chapters wasn't correct in the original publication. Chapter 5 was written by Andrew Beeby and David Howell as co-author, chapter 6 by Kelly Domoney and David Howell as co-author, and chapter 9 is authored by Anita Quye. This will be corrected. We apologize for the mistake.

Since the book first appeared in 1976, *Methods of Seawater Analysis* has found widespread acceptance as a reliable and detailed source of information. Its second extended and revised edition published in 1983 reflected the rapid pace of instrumental and methodological evolution in the preceding years. The development has lost nothing of its momentum, and many methods and procedures still suffering their teething troubles then have now matured into dependable tools for the

analyst. This is especially evident for trace and ultra-trace analyses of organic and inorganic seawater constituents which have diversified considerably and now require more space for their description than before. Methods to determine volatile halocarbons, dimethyl sulphide, photosynthetic pigments and natural radioactive tracers have been added as well as applications of X-ray fluorescence spectroscopy and various electrochemical methods for trace metal analysis. Another method not previously described deals with the determination of the partial pressure of carbon dioxide as part of standardised procedures to describe the marine CO₂ system.

The limited coverage of data analysis and statistics offered in most undergraduate and graduate analytical chemistry courses is usually focused on practical aspects of univariate methods. Drawing in real-
