F. Hajjar², R. T. Leon³ Abstract This paper investigates the use of the Direct Analysis method, established within the AISC Specification for Structural Steel Buildings, for steel-concrete composite beam-columns,

Stability analysis and design of steel-concrete composite ...

Such beams may experience a buckling problem caused by the lack of global or local stability of composite beams subjected to positive moments arising because of the full concrete flange openings. An elastic finite-element model is established to analyse the stability of composite steel – concrete beams with full concrete flange openings.

Stability of steel – concrete composite beams with full ...

The direct analysis method is the primary means of assessing system stability within a standard specification. This method, and in particular its use of reduced stiffness, has been thoroughly validated for use in frames consisting of structural steel members. However, appropriate stiffness reductions have not yet been established nor has the method as a whole been validated for frames with steel-concrete composite columns.

“ The steel plate composite wall system is a natural evolution of the reinforced concrete wall system, ” explains Varma. Image courtesy of AISC The coupled steel-plate composite wall system is a high-strength concrete shear wall sandwiched by two structural steel plates.

Introducing the Steel-Plate Composite Core - CE Center

Composite construction of steel and concrete is a popular structural method due to its numerous advantages against conventional solutions. The optimal combination of the properties of the two most popular construction materials, i.e., steel and concrete, results in structures that are both safe and economic (Vasdravellis et al., 2012). In

cable-stayed bridges, the composite concrete slab over the steel orthotropic deck provides a new option.

Composite Construction - an overview | ScienceDirect Topics

Looking at issues related to steel rebar congestion and concrete placement at the base of thick concrete walls in high-rise buildings, plus the time and effort needed for formwork placement, concrete casting, formwork removal, etc., the steel-plate composite wall system was a next step in structural evolution to address these concerns. ”

CE Center - Introducing the Steel-Plate Composite Core

The steel in SpeedCore can support up to four floors of decking by itself, making it possible to erect four floors in a week. After erection, these panels are filled with concrete, creating a unique sandwich-style structure that provides strength and stability along with the benefits of rapid erection.

The concrete acts as the compression material and the steel deck bonded to the bottom of the concrete acts as the tension reinforcing steel. The bending capacity of the composite steel deck must be sufficient to resist out of plane gravity loads on the deck, which are typically superimposed dead and live loads in addition to the concrete
